Submission Date: 09-04-2026

01. Introduction about the Project

1.1 Project Domain

This project is about developing a web-based saloon management system to “Harshi Ladies Salon” a local beauty and wellness center offering hair, skin, and cosmetic services, who currently find it difficult to continue with the traditional way of service provision, which makes it challenging for both staff and customers to manage appointments and services efficiently. Salon provides customers with different types of services and introduces packages. Also, appointment bookings are handled manually by customers giving a phone call or making a visit to the salon and all service records, payments, and customer details are maintained manually. The salon provides a variety of individual services as well as service packages, but the existing manual approach leads to inefficiencies, errors, and difficulty in tracking customer preferences and service history. The proposed system falls within the domain of Salon Management Software, which aims to automate and streamline operations such as appointment booking, payment processing, and customer relationship management. The project will provide a digital platform where the salon staff can efficiently manage all operations, reduce errors, and enhance customer experience.

1.2 Existing Problems

- Difficulty in Customer Record Keeping
 - Maintaining customer history, preferences, and service records in notebooks cause duplicates and redundancies. Retrieving past records for follow-ups or personalized services consumes unnecessary time.
- Operational Inefficiency
 - Staff members spend significant time on administrative tasks rather than focusing on customer service and also face difficulties managing their daily schedules, leading to lower overall productivity.
- Inefficient Appointment Management
 - Scheduling appointments manually leads to double bookings or missed slots. There is no automated reminder system, which results in clients no shows or confusion.
- Inefficient Payment Management
 - Payments and receipts are recorded manually, increasing the risk of mistakes, and making it difficult to track financial transactions accurately and reduce the ability to calculate correct profit amounts.

- Inefficient service selection/recommendation
 - A considerable amount of time is wasted on both staff and customers when selecting services such as hairstyles, nail arts, and make-up looks, because there is no proper system in place to pre-select or organize these options in advance.

02. Requirements Elicitation Techniques Used

Requirements elicitation techniques are a crucial part of our project. Requirement elicitation helps to identify and understand what functionalities and features are needed in the system we are building, ensuring that the final product will meet the stakeholders' needs.

To apply these techniques to our projects, first we identified the stakeholders of this business and categorized them into primary, secondary and tertiary stakeholders then conducted questionnaires, interviews and observations to gather the requirements.

1. Stakeholder Categorization

Stakeholders are any person or organization who is affected by the system in some way and who has a legitimate interest. Based on their needs the systems features and functionalities get developed. And helps with understanding which users had the most influence on the system requirements.

2. Techniques Used

- I. **Interview** - Interviews are a requirement elicitation technique used to gather detailed information directly from key stakeholders. We conducted a well-planned interview with the business owner and identified the problems they face with the current business operations. Through this interview, we were able to discover the owner's expectations for the system and the features they require.
- II. **Questionnaire** - Questionnaires are useful for collecting information from multiple stakeholders efficiently. For the other stakeholders, we conducted a questionnaire to gather their input. The questionnaire included questions about their roles and the issues they encounter with the current approach. This process helped us identify their precise requirements.
- III. **Observation** - Observation is a technique used to understand how the current system operates in a real environment. We also conducted an observation session to examine the business environment and identify other factors to consider when developing the system.

3. Outcome of Elicitation

The requirement elicitation techniques we applied helped us identify key functionalities that the system must provide, such as appointment management, service management, and user management, payment management and service selection.

4. Challenges and Insights

The challenge was that some of the stakeholders were not clear about the technical aspects of the information, and hence we had to define the terms in the questions. However, the process gave us an understanding of the needs of the users.

03. Discussion, Limitations, and Lessons Learned

During the requirement elicitation and analysis phase we faced several challenges. Major problem we encountered was that the salon operates on a small scale with lesser number of members, which leads making it difficult to gather diverse perspectives. So, the most of the requirements were based on owners' perspective, which may not fully represent all user needs.

And the next we faced was that some of the stakeholders were not much familiar with digital systems, which make them difficult to express their requirements in technical terms. This required simplifying questions and explaining concepts in a more understandable way.

Then there were also limitations in the analysis process, as this study was conducted among limited number of people within a single salon environment. Also, time constraint was also there, only a small number of observations and interactions were involved, which may affect the completeness of the requirements gathered.

Even though there were challenges and limitations, several important lessons were learnt.

- Process highlighted the importance of clear communication.
- Importance of to adapt elicitation techniques based on different types of stakeholders understanding levels.
- Showed no matter the size of the business, structured systems significantly benefit to improve efficiency and organization.

In future improvements, we could make the analysis better by involving more people doing more observation sessions and using more detailed questionnaires to gather more insights, about the analysis.

04. Functional and Nonfunctional requirements

4.1 Functional Requirements

Epic - Admin and Customer Management

a. FR1 - User Registration

Field	Description
Input	User information (name, email address, phone number, password, role)
Processing	Validate user information, confirm email/phone uniqueness, password hashing, store user information
Output	Successful registration message
Definition	User information includes name, valid email address, phone number, password, and role

b. FR2 – User Authentication (Login/Logout)

Field	Description
Input	Username and password
Processing	Validate login credentials, determine active/inactive status, and role-based authentication
Output	Successful login notification and dashboard access or unsuccessful login message
Definition	Authentication is relevant to all users in the system – customer, owner, employee, and receptionist

c. FR3 – User Profile Management

Field	Description
Input	Information that has been updated (name, email, phone, address, password may be included)
Processing	Update information based on validation, update user profile in database
Output	Message confirming the update
Definition	Users have the ability to access and update their own profiles

d. FR4 – User Role Management

Field	Description
Input	User ID, role to be assigned (customer, staff, receptionist, owner)
Processing	Role validity check, assigning user role, constraint implementation
Output	Database update role column confirming role assignment and display in profile role column
Definition	Owner has the authority to assign or alter user roles

e. FR5 – User Search & View

Field	Description
Input	Keyword for searching (Email and Username)
Processing	Search the user database and list relevant results
Output	Relevant users' listing

Definition	The search function will be confined by the user role
-------------------	---

f. FR6 – Role-Based Access Control

Field	Description
Input	The user's logged-in state and resource being accessed
Processing	Test role permissions to either allow or deny access
Output	Access granted/Access denied
Definition	The system confines functionality depending on the user roles

g. FR7 – Password Changing

Field	Description
Input	Existing password, new password
Processing	Check existing password, implement password policy, change password in encrypted form
Output	Confirmation message of password change
Definition	Allowing users to reset/change their password

h. FR8 – View Service History

Field	Description
Input	Customer identification name or email
Processing	Fetch the history of the customer from the system

Output	Service history of the customer
Definition	Customers only have access to their history

Epic – Service Management**a) FR1 – Service Category Management (Create, Update, Delete, View)**

Field	Description
Input	Information on categories (Category Name, Description)
Processing	Data validation for categories, creation, modification, deletion of categories, listing of categories
Output	Confirmation for creating/modifying/deleting categories or listing of categories
Definition	Service Categories refer to grouping of services (Hair, Skin, Nails)

b) FR2 – Service Management (Create, Update, Delete, View Services)

Field	Description
Input	Service information (Service Name, Price, Description, Category ID, Duration)
Processing	Data validation for services, linking services to their respective categories, creation, modification, and deletion of services
Output	Message confirming creation/modification/deletion of services or details of services
Definition	Services are individual offerings within specific categories within a salon

c) FR3 – View Services by Category

Field	Description
Input	ID of selected category
Processing	Listing of services based on the selected category
Output	Listing of services according to the selected category
Definition	Allow users to list out the services according to the selected category

d) FR4 – Service Details Viewing

Field	Description
Input	ID of selected category
Processing	Retrieval of all service information stored in the system
Output	Details of selected service (Price, Description, Duration, Category)
Definition	Lists detailed information on selected services

e) FR5 – Cart Management (Create, View, Update, Delete Items)

Field	Description
Input	ID of selected services, cart actions
Processing	Creation of cart, adding selected services to the cart, modifying quantities, removing services from the cart, calculating total price
Output	Details of current cart including service selection and total price

Definition	Cart refers to a temporary storage of services selected by the user
-------------------	---

f) FR6 – View Cart Services

Field	Description
Input	Session ID/user id
Processing	Display all services kept in user's cart
Output	List of services present in cart along with total price
Definition	Presents all chosen services before booking/checkout

Epic - Package Management**a) FR1 – Package Management (Create, Update, Delete, View)**

Field	Description
Input	Details about the package (Name, Description, Services, Price, Duration, Category, Status)
Processing	Validation of the package data, association with the package services, saving/creation/updating/deleting of package data in the system
Output	Confirmation of creation/updating or list of available packages
Definition	Maintains all the aspects of management of the service packages including CRUD operations

b) FR2 – Package Browsing and Search

Field	Description
Input	Package keyword to search and other filters (Price, Category, Name)
Processing	Fetching relevant packages from the database of the system
Output	List of Packages available
Definition	Enables customers to browse/search for available packages

c) FR3 – Package Details Viewing

Field	Description
Input	Package ID

Processing	Get information about the selected package with all its features like services, price, and duration
Output	Information regarding the package
Definition	Discloses details regarding the packages

d) FR4 – Package Enhancement Features

Field	Description
Input	Promotions, Premium Packages and Staff Skills Required
Processing	Mark package status for promotions/premium packages and assign staff skills needed
Output	Status of the packages and relevant information
Definition	Enables marketing of packages, promotions etc.

Epic - Appointment & Payment Management

a) FR1 – Appointment Management (Book, Update, Cancel, View)

Field	Description
Input	Service type, date, time, customer ID, appointment specifics
Processing	Check availability, establish appointment record, permit rescheduling/updates, or cancellation
Output	Appointment confirmation, new schedule, or cancellation notice
Definition	Permits customers to completely control appointments, from booking to rescheduling, updating, reviewing, and cancellation

b) FR2 – Appointment Monitoring (Customer & Owner View)

Field	Description
Input	User ID (customer/owner)
Processing	Query appointment database by user ID and filtering options (upcoming/past/total)
Output	Display list of appointments
Definition	Assists customers in monitoring their appointments while allowing owners to track all appointments within the system

c) FR3 – Payment Processing and Management

Field	Description
Input	Appointment ID, payment information, payment means

Processing	Conduct online payment, confirm payment, modify payment status (Paid/Pending/Refunded)
Output	Payment confirmation and updated payment status
Definition	Manages online payments and maintains proper payment status management

d) FR4 – Payment History and Status Management

Field	Description
Input	Customer ID / Appointment ID
Processing	Gather payment history data, enable receptionist/owner to adjust payment status
Output	Payment history data or modified payment status
Definition	Manages payment history for customers and payment status updates for staff/receptionists

Epic - Feedback & Rating System**a) FR1 – Feedback Management (Create, Edit, Delete Reviews)**

Field	Description
Input	Customer feedback input, rating score, name of service/provider (optional), feedback ID
Processing	Check feedback information, add new feedback, edit submitted feedback, and delete invalid and fake feedback
Output	Feedback confirmation, modified feedback list, or feedback deleted
Definition	Provides customers with an opportunity to give, edit, and delete their feedback while monitoring the system

b) FR2 – Rating and Review Viewing (Admin & Staff Access)

Field	Description
Input	User role (admin/service provider), service ID, staff ID
Processing	Get and display ratings/reviews considering user role and their associated service or provider
Output	Ratings and review reports
Definition	Let admins control ratings of all users, and staff can check reviews related to their services

Epic - Style Recommendation System

a) FR1 – Style Recommendation Management (Admin Configuration)

Field	Description
Input	Rules for style generation, configuration information, style database for salon, administration information
Processing	Administrator defines the rules and database for style recommendation system, incorporating the system into the salon
Output	Activation/confirmation of updated configuration of the system
Definition	Gives the administrator control over the creation and management of the style recommendation engine in the salon

b) FR2 – Style Recommendation and Customer Usage

Field	Description
Input	Attributes of the customer (face shape, skin type, preferences), contextual information
Processing	Analysis of the customer attributes according to professional rules defined by the system and generation of the suitable styles
Output	List of styles that should be recommended to customers
Definition	Generates styles to recommend to the customers

4.2 Non-Functional Requirements

NFR1	Performance
Description	The system will take less than three seconds to load and display pages upon request for 95% of the requests made by users under normal operation and with no more than 100 users concurrently connected to the system.

NFR2	Usability
Description	The system shall provide a user-friendly interface that allows users to complete common tasks (registration, booking, payment, and viewing services) within 3–5 steps without requiring technical knowledge.

NFR3	Security
Description	The system will authenticate users securely by encrypting their passwords and implementing role-based access control to prevent unauthorized access to confidential information and capabilities.

NFR4	Reliability
Description	The system will guarantee 99% availability during operation hours and protect data loss during system failure by properly implementing data persistence techniques and backup.

NFR5	Scalability
Description	The system will have sufficient capacity to expand its resources in the future to support more users, services, and transactions without modifying its design significantly.

4.3 Constraints

C1 – Platform Constraint

The software should be developed using modern web technology and be compatible with any modern browser such as Chrome, Firefox, and Edge. The application should not require any installation to be accessed and used by the end-users.

C2 – Device Constraint

The software should be optimized for desktop and laptop devices while mobile device support is optional.

C3 – Booking Constraint

The software should ensure that the same booking period cannot be assigned to more than one client for a particular service offered by a staff member.

C4 – Security Constraint

The software should be capable of securing all user data by implementing proper authentication and authorization methods. It should also include secure password storage.

C5 – Payment Constraint

Appointment bookings should only be confirmed if there is a successful payment validation, and all payments should have valid statuses such as Paid, Pending, or Refunded.

05. System Models

5.1 UML Class Diagram

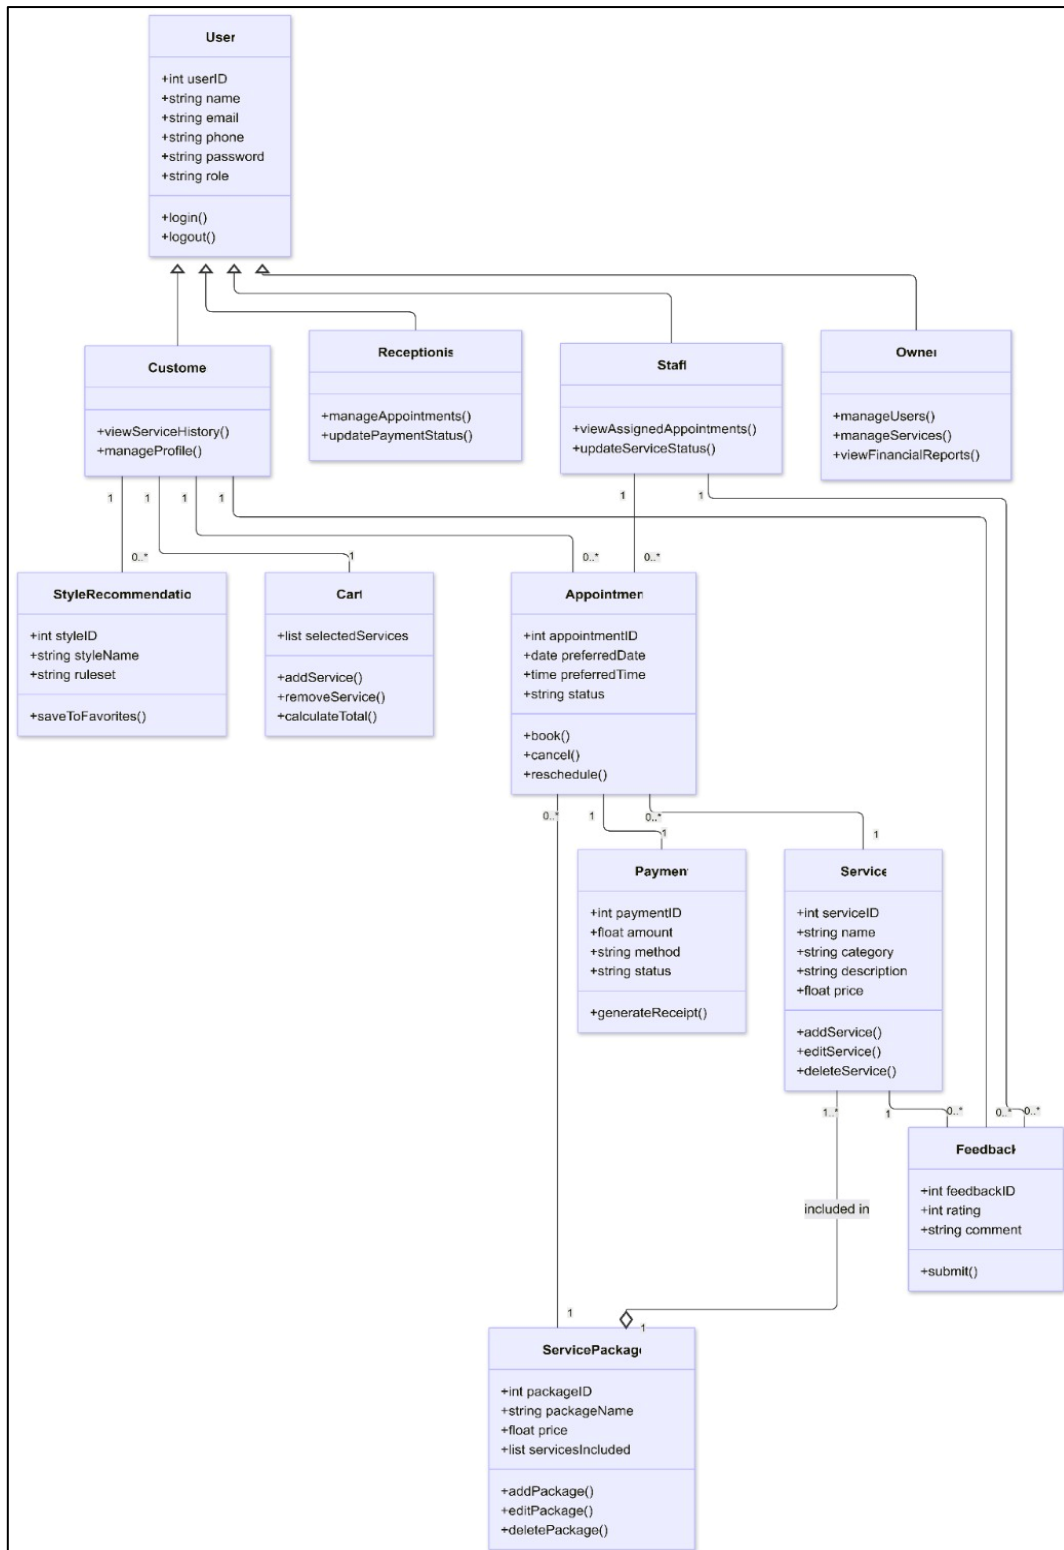

Commentary

This diagram provides a static view of the system, showing the attributes, methods, and relationships between different objects.

The User class is a parent class. Specific roles like Customer, Staff, Receptionist, and Owner inherit its basic attributes (name, email, password) but have unique operations.

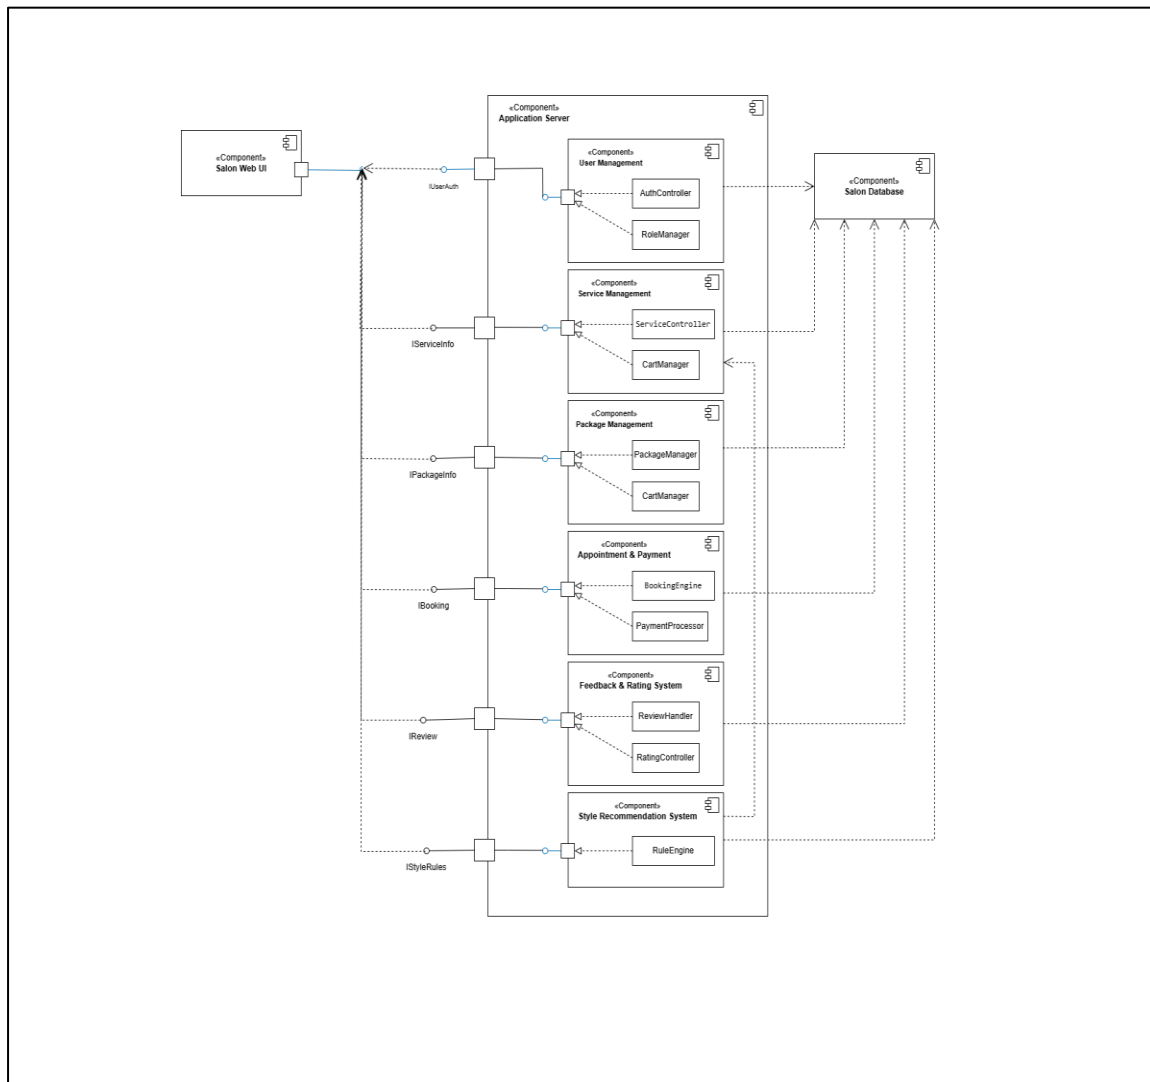

The numbers at the ends of the lines (1 to 0..*) show how many objects can be linked. Example: One Customer can have many (0..*) Appointments.

The relationship between Service and ServicePackage (indicated by the diamond shape) shows that multiple individual services are combined to create a single package.

5.2 UML Physical Diagram

Component Diagram

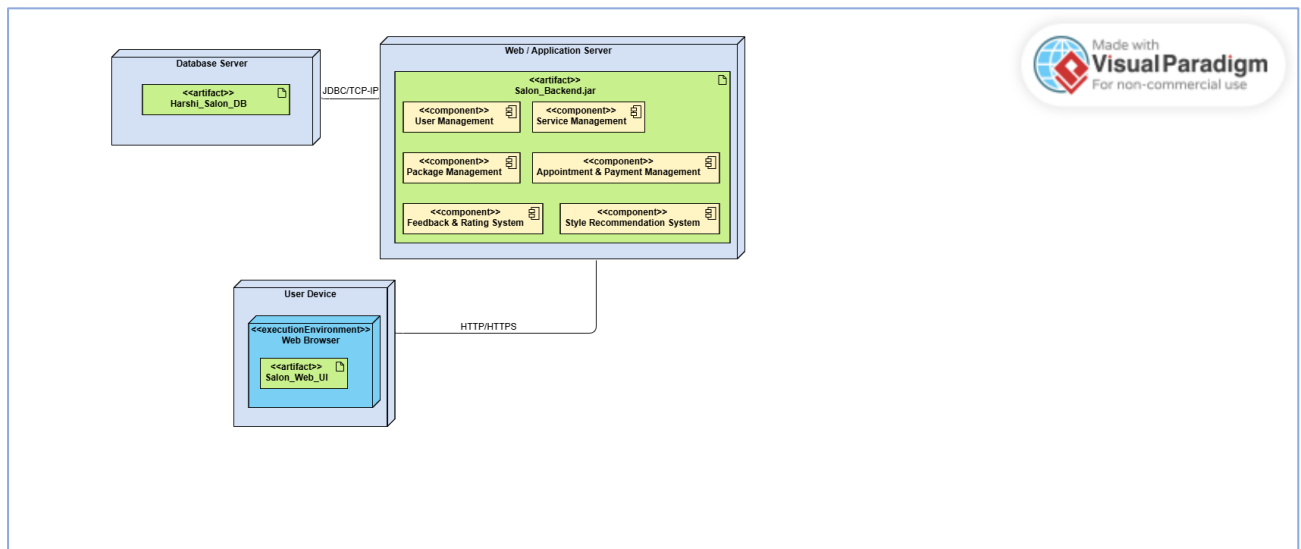

Commentary

This diagram represents the physical software structure of our salon management system. It shows how each Functions of our system interact as independent components. The system is divided into three logical layers: the Presentation Layer (Salon Web UI), the Logic Layer (Application Server), and the Data Layer (Salon Database).

Assembly Connectors (Lollipops & Sockets) represent the contracts between components. A circle (lollipop) is a Provided Interface, while a half-circle (socket) is a Required Interface. For example, the Salon Web UI requires the IUserAuth interface to allow users to log in. Inside each component, internal classes (like AuthController or BookingEngine) use dashed lines with hollow arrows to show they provide the actual logic for that component's interface.

Deployment Diagram

Commentary

This diagram illustrates the hardware configuration and how the software artifacts are distributed across physical nodes

Nodes (3D Cubes) represent the physical/virtual hardware.

There are three primary nodes: the User Device (Customer/Staff laptop), the Web / Application Server, and the Database Server.

Artifacts (Document Icon) represent the actual files deployed on the hardware. For example, Salon_Backend.jar is the compiled package containing all business logic.

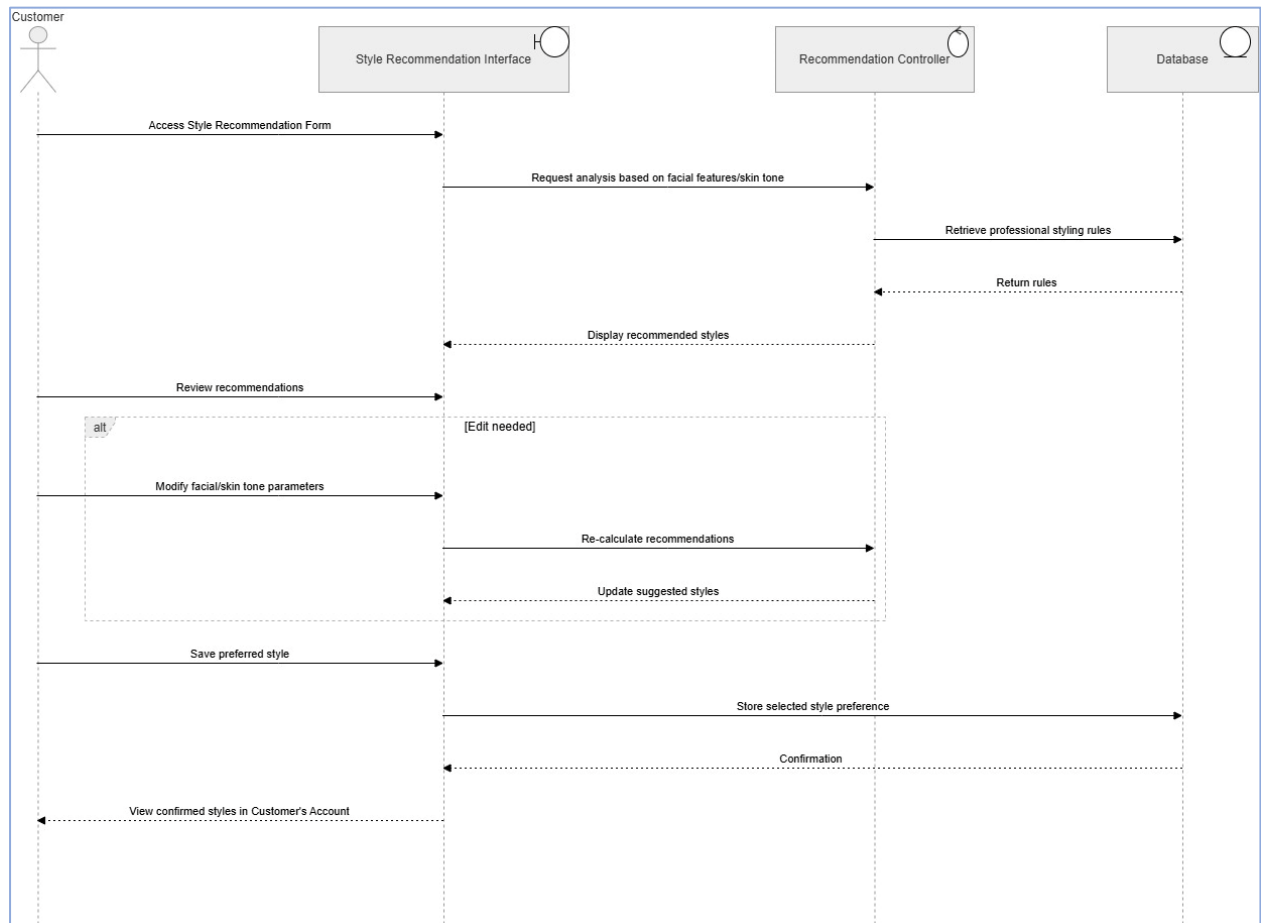

Execution Environment is the Web Browser on the User Device and it acts as the environment where the Salon_Web_UI artifact runs.

HTTP/HTTPS used for communication between the user's browser and the web server, because the system is accessible via the internet.

JDBC/TCP-IP represents the secure connection between the backend logic and the database server for retrieving and storing records.

5.3 UML Sequence Diagrams

Customer and a rule-based Style Recommendation System Interaction

Commentary

This sequence diagram shows the interaction between the Customer and a rule-based Style Recommendation System.

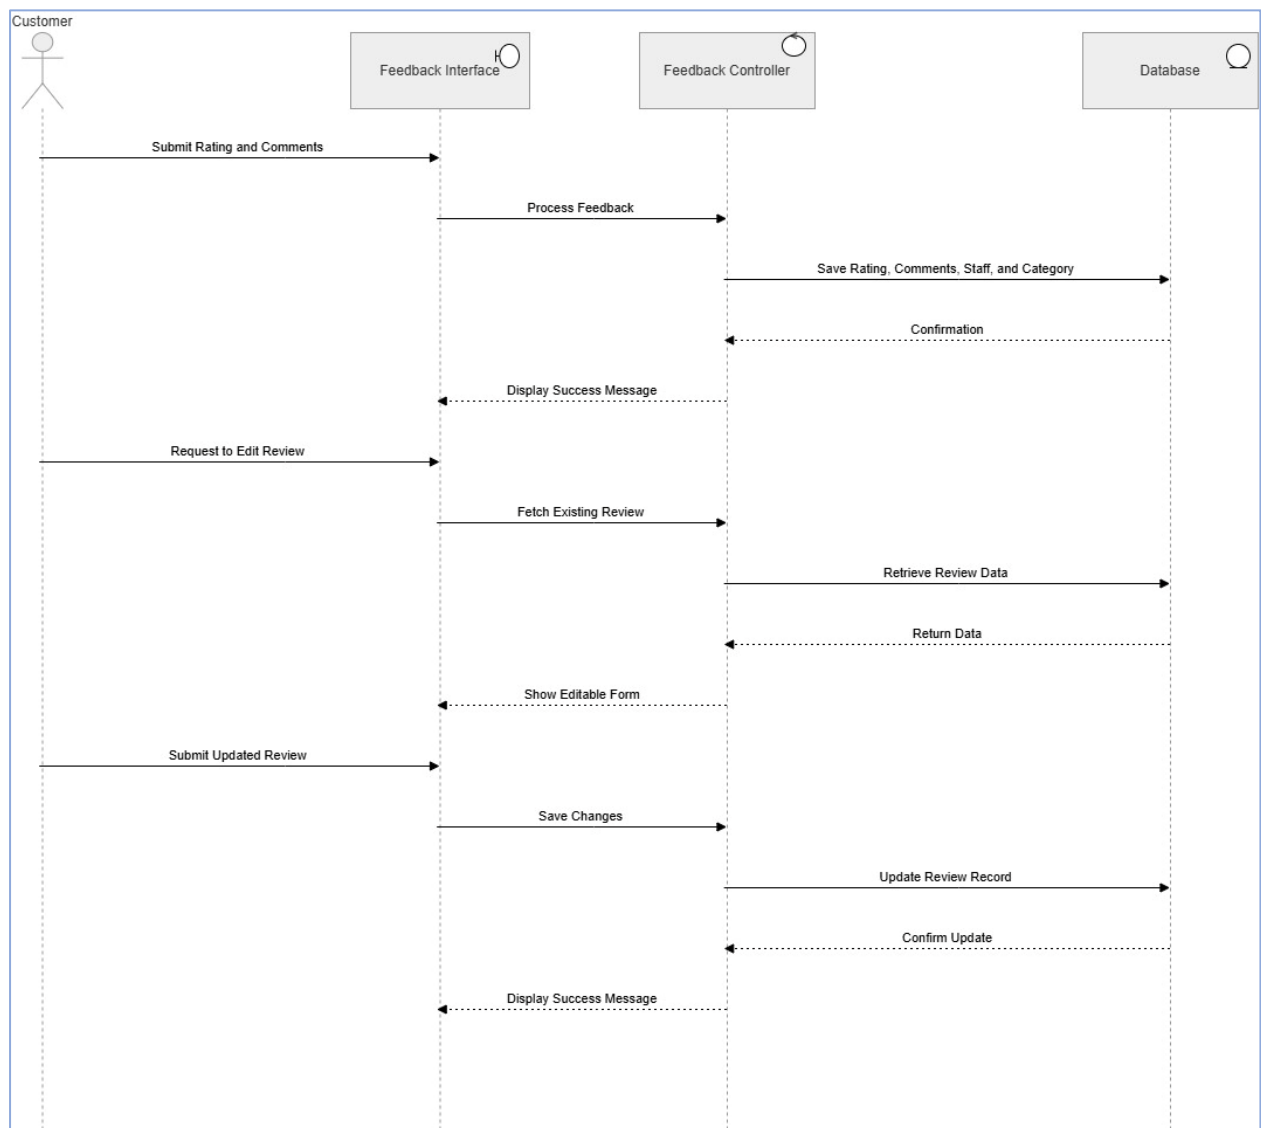

The process starts when the customer accesses the form and requests analysis based on facial features and skin tone.

The controller retrieves professional styling rules from the database and generates suitable recommendations.

If necessary, the customer can modify inputs, and the system recalculates updated suggestions.

Finally, the selected style is saved, confirmed, and made available in the customer's account.

Procedure of customer submits feedback

Commentary

The diagram shows how a customer submits feedback, which is processed and stored in the database with confirmation.

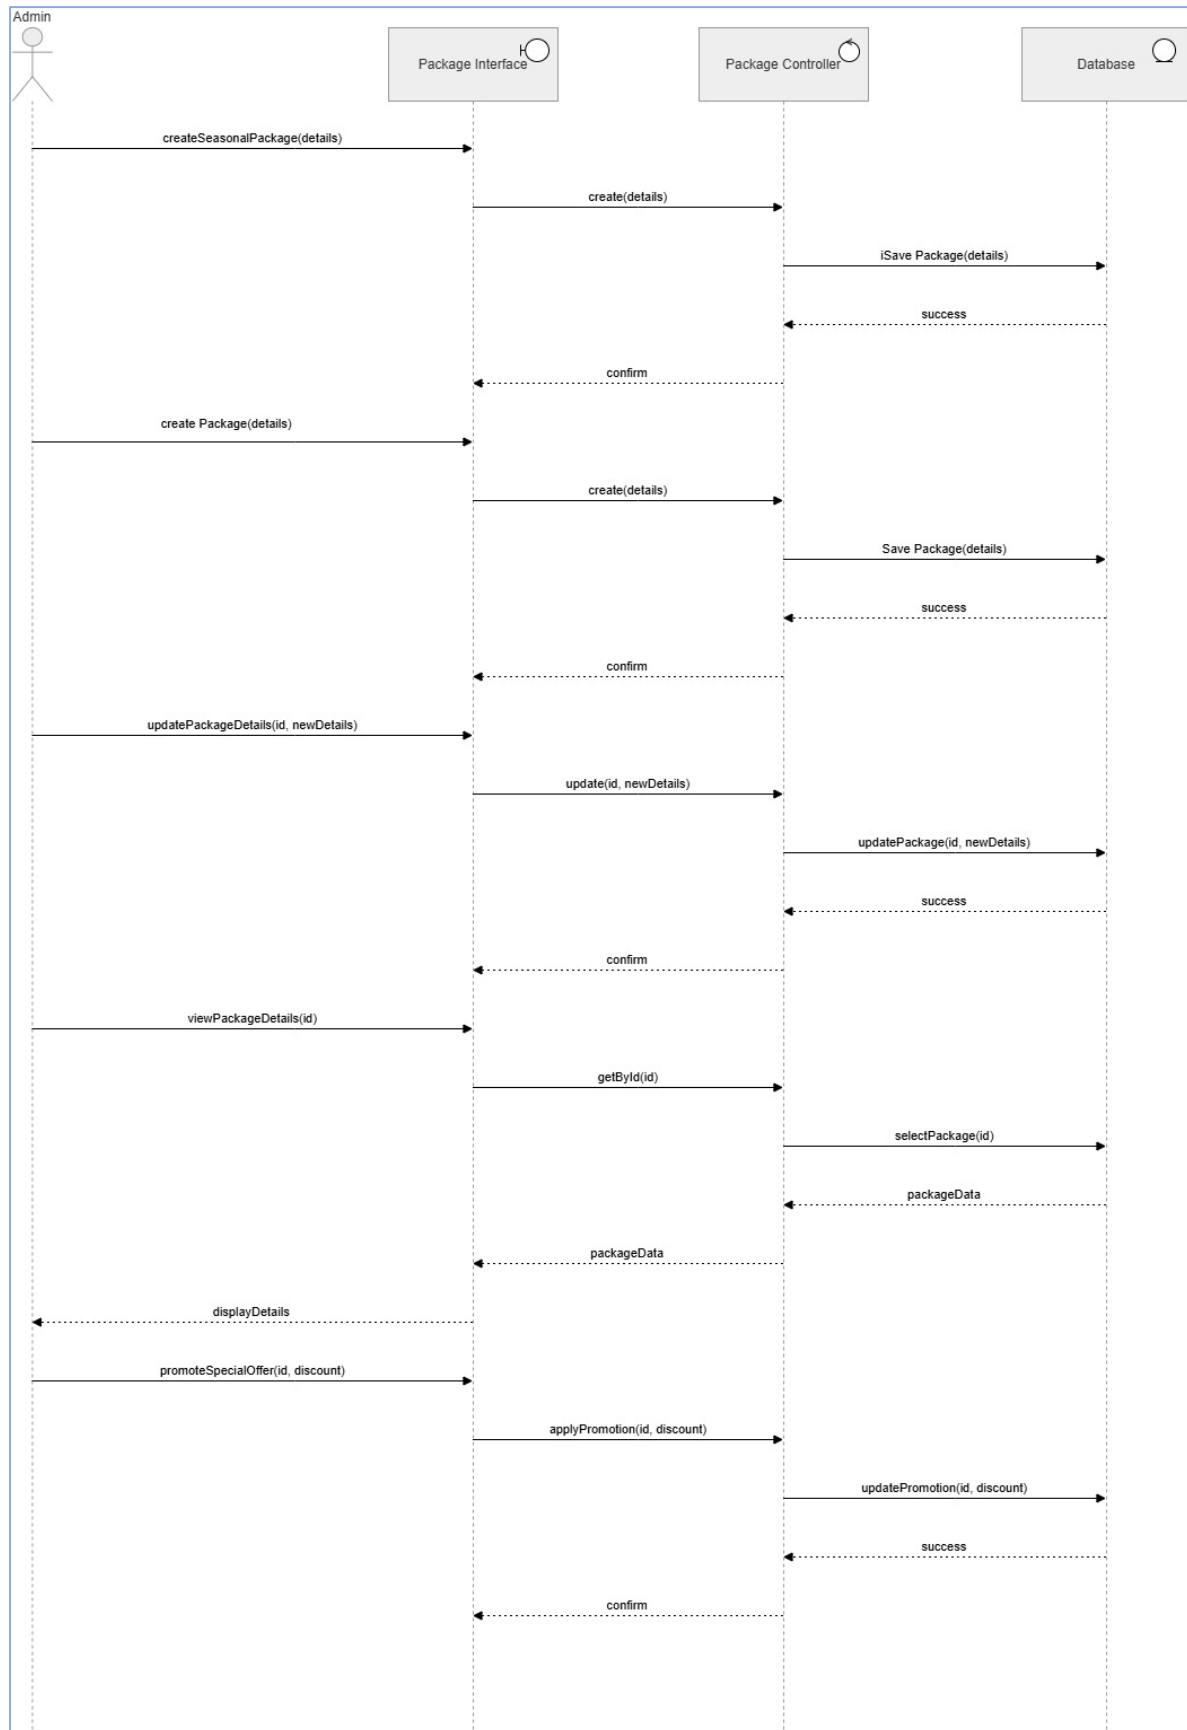

It also illustrates retrieving existing reviews when the user requests to edit them.

After updates are made, the system saves the changes and displays a successful message.

Admin managing a travel package

Commentary

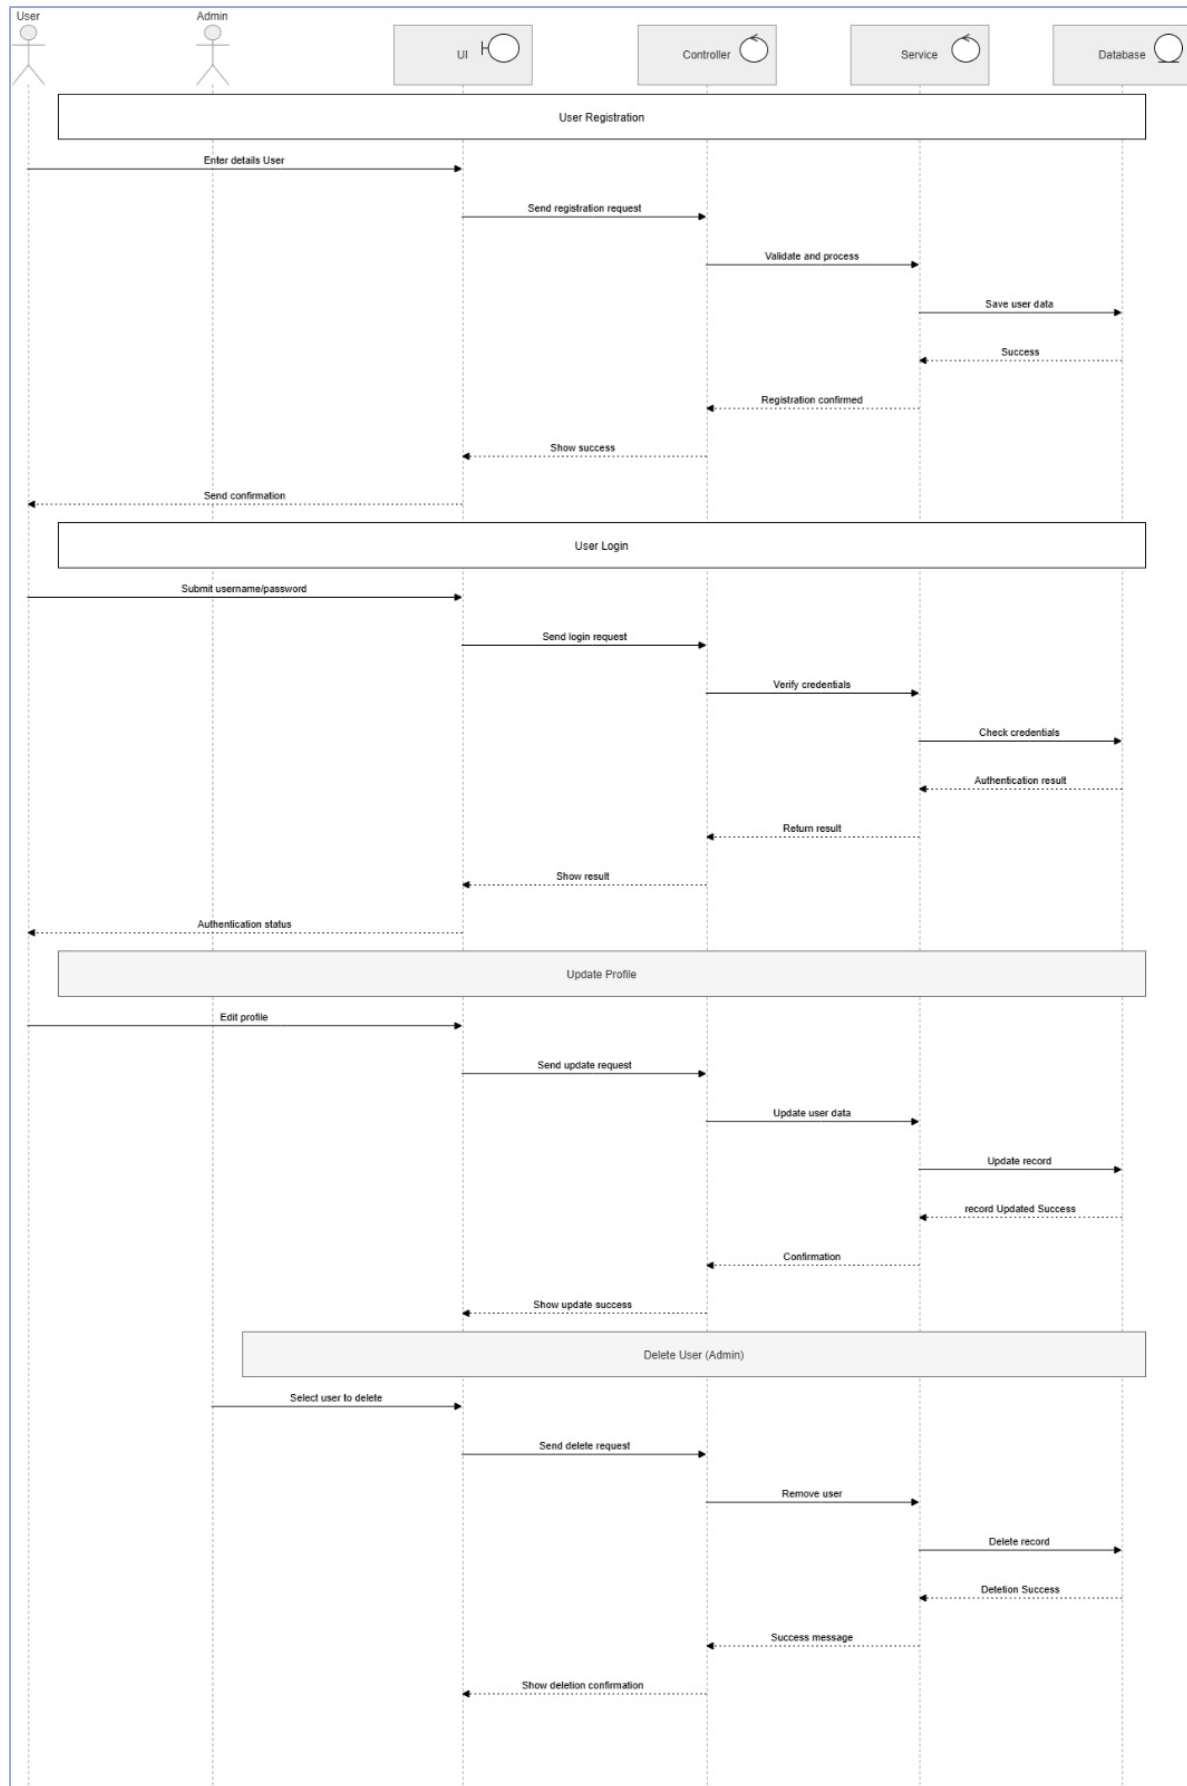

This sequence diagram shows the admin managing travel packages through a Package Interface, Controller, and Database, where packages can be created, updated, and viewed via a consistent request-response flow. The admin can retrieve specific package details by ID and apply updates across all three layers with success confirmation returned at each step. Additionally, the promote special offer operation allows the admin to apply discounts to existing packages, triggering a database update and returning a final confirmation.

User Management Operations

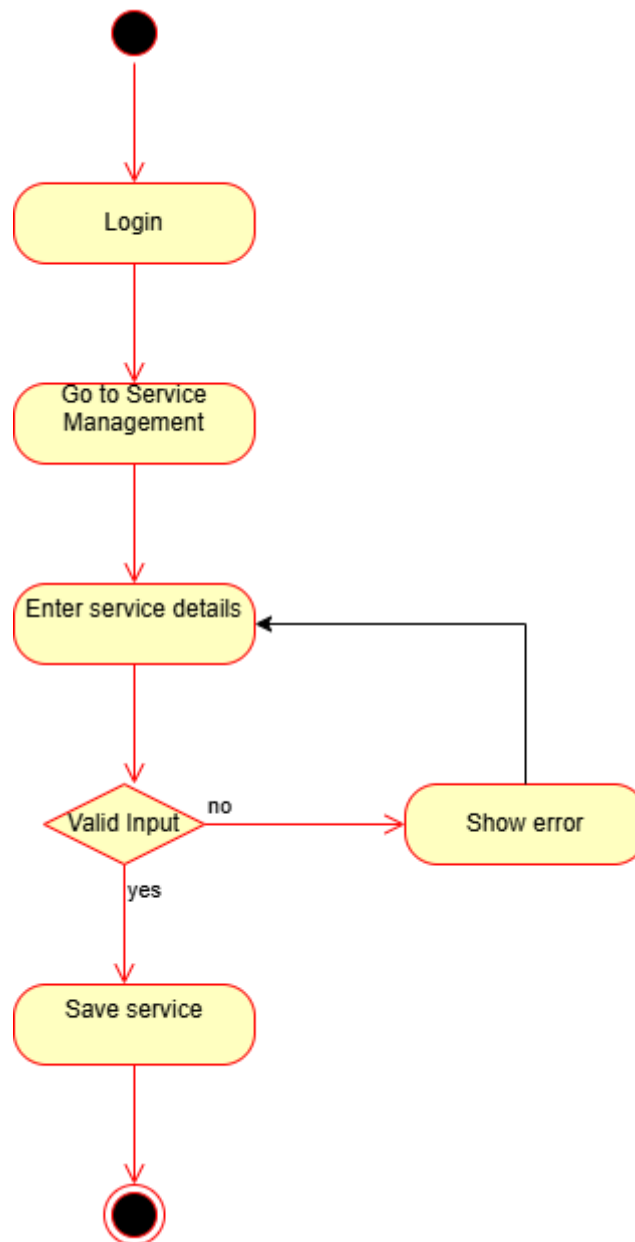

Commentary

This sequence diagram illustrates four user management operations — Registration, Login, Update Profile, and Delete User — across a UI, Controller, Service, and Database architecture. Registration and Login handle user onboarding and credential verification, while Update Profile allows users to modify their information, all returning confirmations upon success. Delete User is an Admin-only operation that removes a selected record from the database and returns a deletion confirmation.

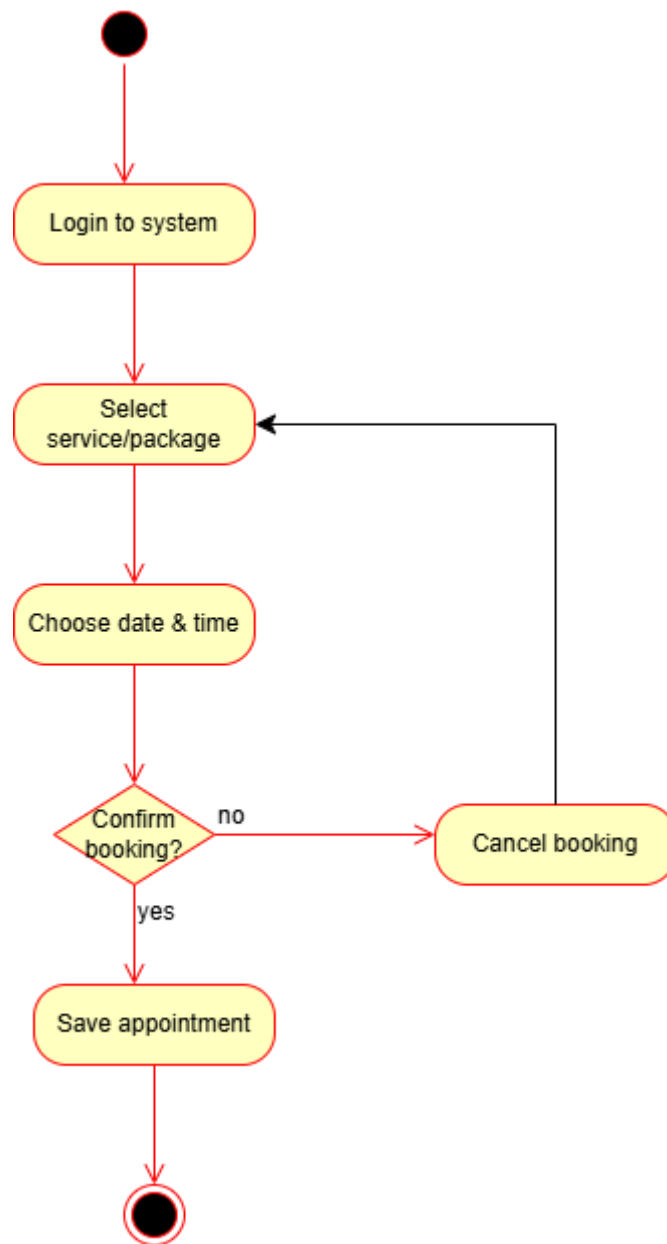

5.4 UML Activity Diagrams

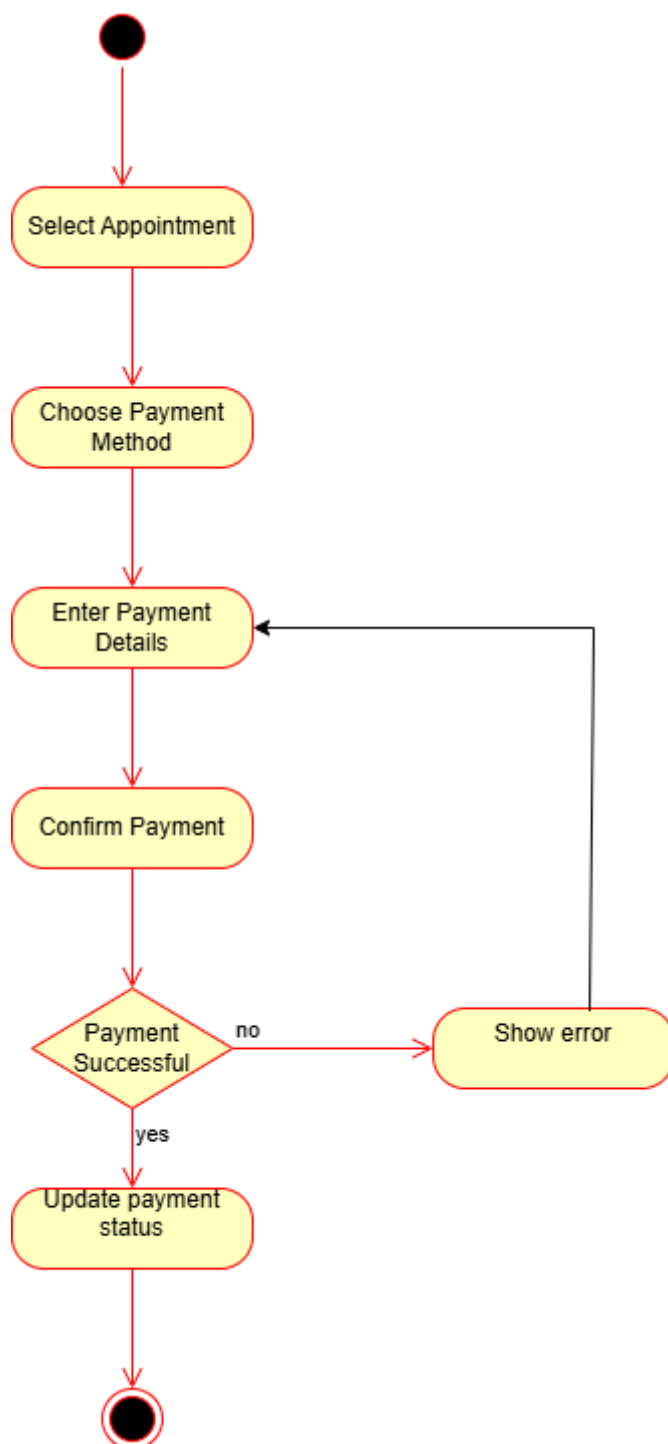

Add Service

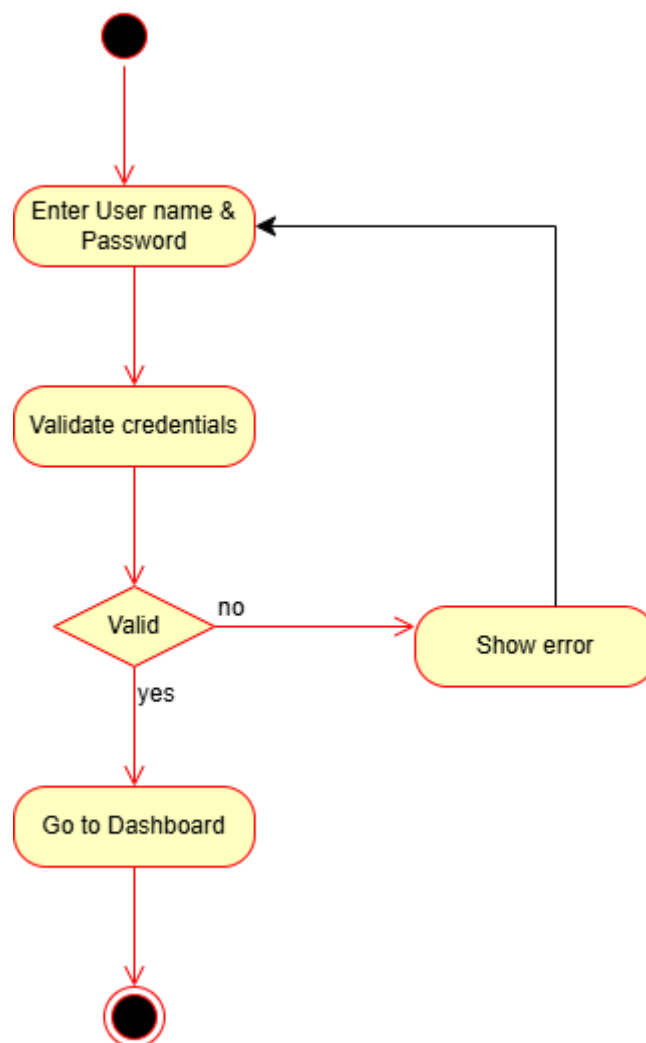

Book Appointment

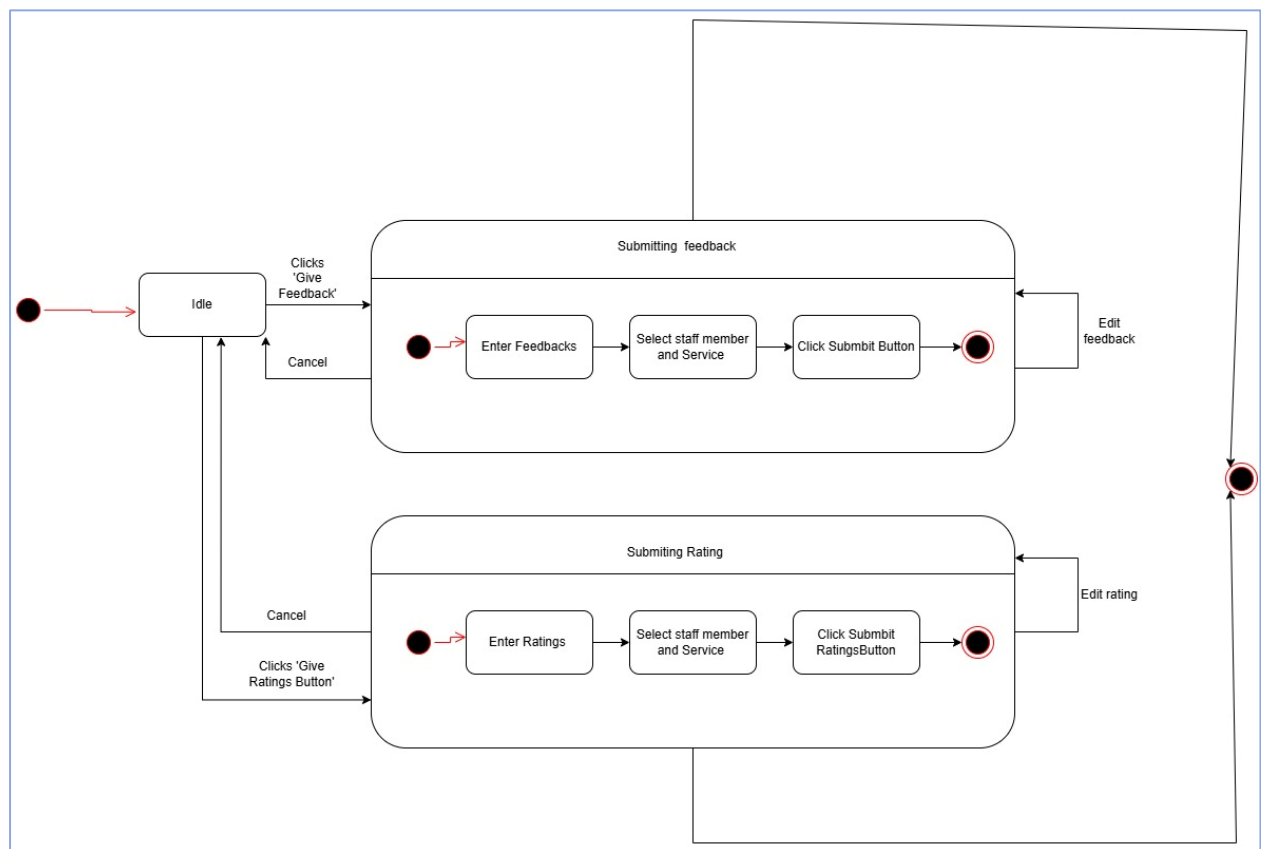

Making Payment

User Login

5.5 UML State Diagram

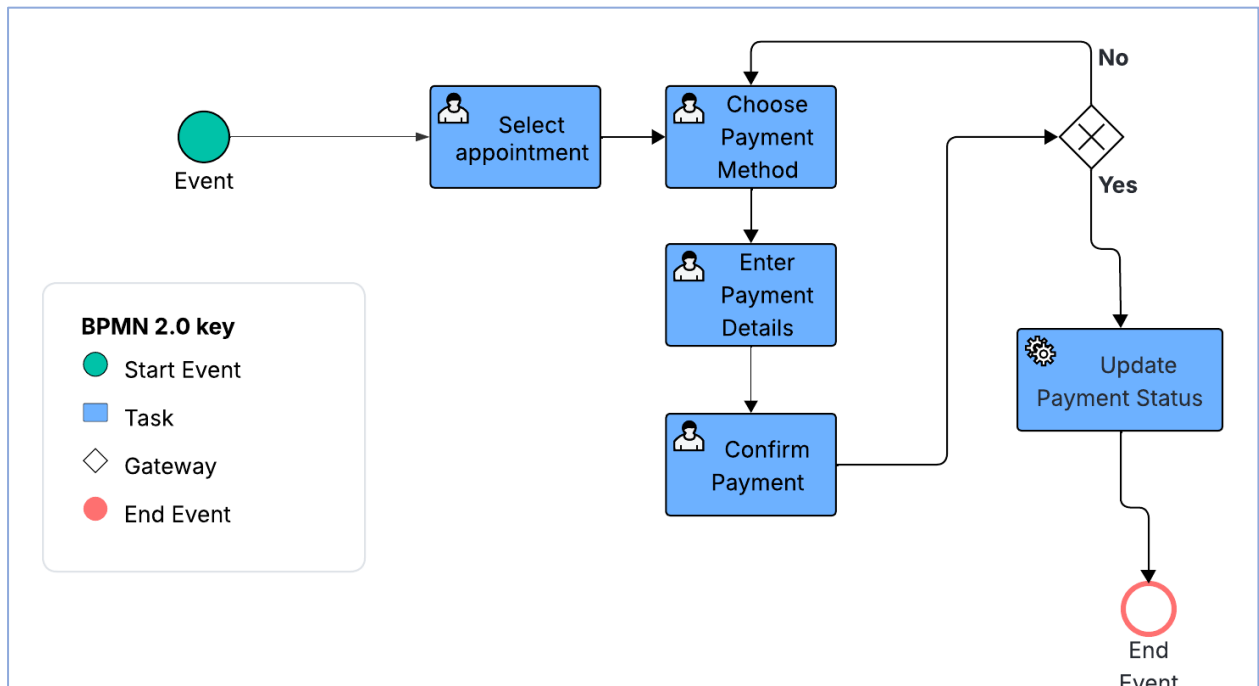

Commentary

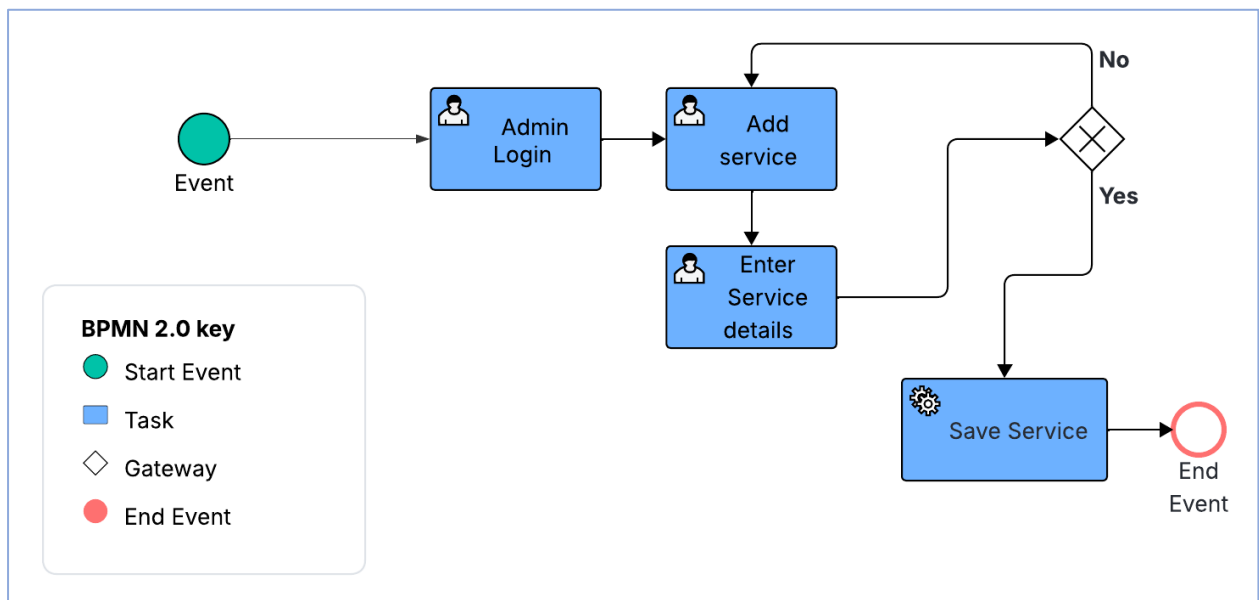

This state machine diagram illustrates a dual-path workflow for user input, transitioning from an **Idle** state to either **Submitting feedback** or **Submitting Rating**. entering data, selecting staff/services, and clicking submit—while allowing for an **Edit** or a complete **Cancel** back to the start. The diagram concludes with a final transition point, ensuring that once a submission is finalized, the system reaches a defined end state.

Style Recommendation System Management – IT24103389

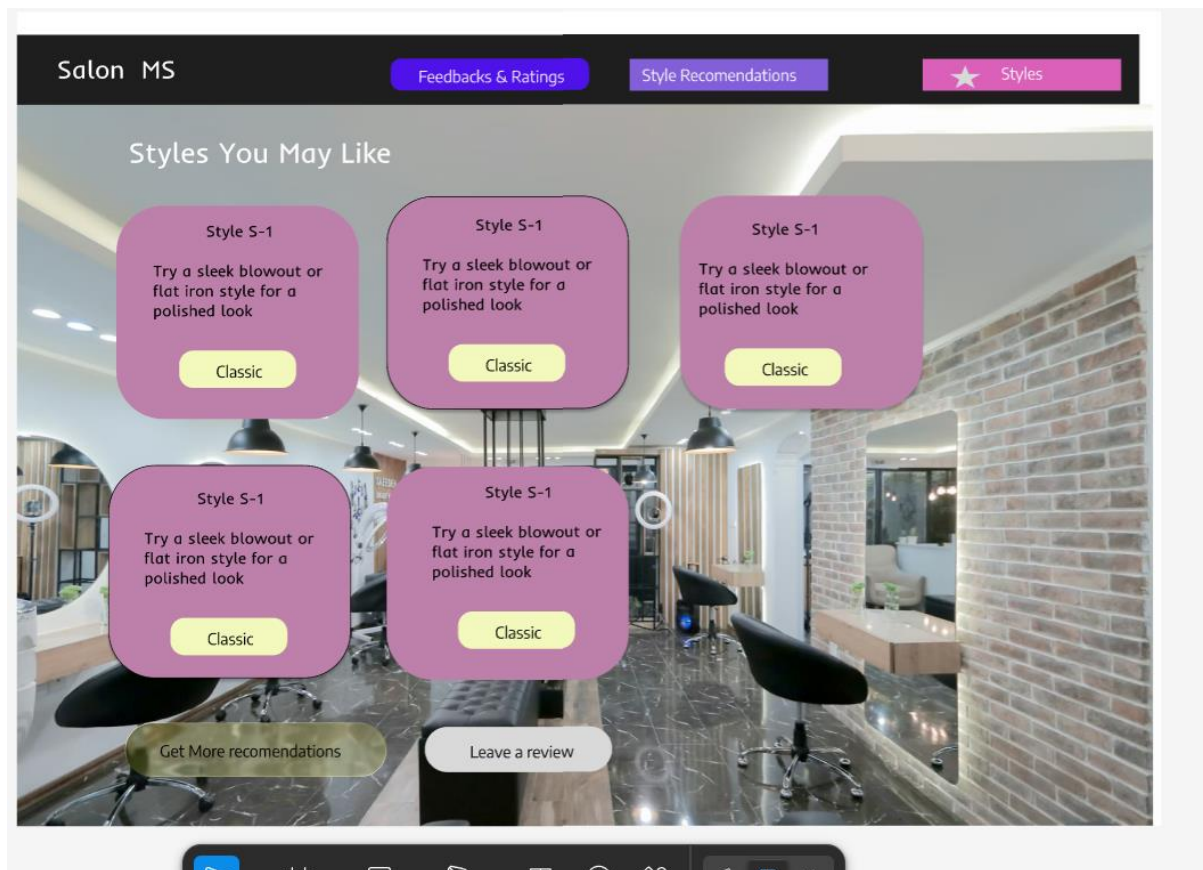

1. Create a Style

The screenshot shows the 'Salon MS' application interface. At the top, there is a navigation bar with 'Salon MS' on the left and three buttons: 'Feedbacks & Ratings', 'Style Recommendations', and 'Styles' (highlighted with a star icon). The main content area features a background image of a modern hair salon. On the left, a pink rounded rectangle contains the text: 'Personalised for you', 'Discover Your Perfect Style', and 'Tell us about your unique features and we'll craft personalised hair and style recommendations just for you. Save the ones you love and revisit them anytime.' On the right, a pink overlay titled 'Your Profile' contains four identical 'Hair Type' selection forms, each with a 'Select' dropdown menu.

2. Generate Recommendations

The screenshot shows the 'Salon MS' application interface. At the top, there is a navigation bar with 'Salon MS' on the left and three buttons: 'Feedbacks & Ratings', 'Style Recommendations', and 'Styles' (highlighted with a star icon). The main content area features a background image of a modern hair salon. In the center, a pink overlay titled 'Curated just for you' and 'Your Recommendations' displays a list of recommendations. Each recommendation is a pink rounded rectangle containing the text: 'Try a sleek blowout or flat iron style for a polished look.' To the right of each recommendation is a heart icon and a 'save style' button. Above the list, a pink bar displays the user's profile: 'Profile - Hair: straight - Face: oval - Eyes: brown - Skin: fair - Style: classic.' At the bottom of the overlay, there are two buttons: 'Try Again' and 'View Saved Files' (highlighted with a star icon).

3. Save Styles
